

## Rough Grade Erosion control

25feb06 – looking east from Lots 2-3, the complete hill was cut out, and sod planted for erosion control

A close-up of the sod erosion control method; a multitude of wooden stakes are nailed in to hold the sod in place, some day the stakes will decay and become an organic root base

25feb06 - This area is in front of lots 7-9, there is a gradual slope to the left that continually weeps water which runs clean in the ditch to the culvert near the top of the photo. Once it dries up we will compact smooth and either crown or slope. This complete stretch will require 3" GeoWeb for proper support and drainage. Much of the area on the right end of the culvert (top center) is already retained by GeoWeb
